Source Compilation Guide

1. Install the prerequisites: gcc, g++, make

    Ubuntu: **sudo apt update && sudo apt install build-essential**

    CentOS: **sudo dnf group install "Development Tools"**

2. Download the source files from the official Website

3. Check the integrity of the tarball (hash or digital signature)

4. Extract the archive and move into the resulting directory

5. Run: **./configure --help** and set the required compilation options

6. Run: **make**

7. Run: **make install**
